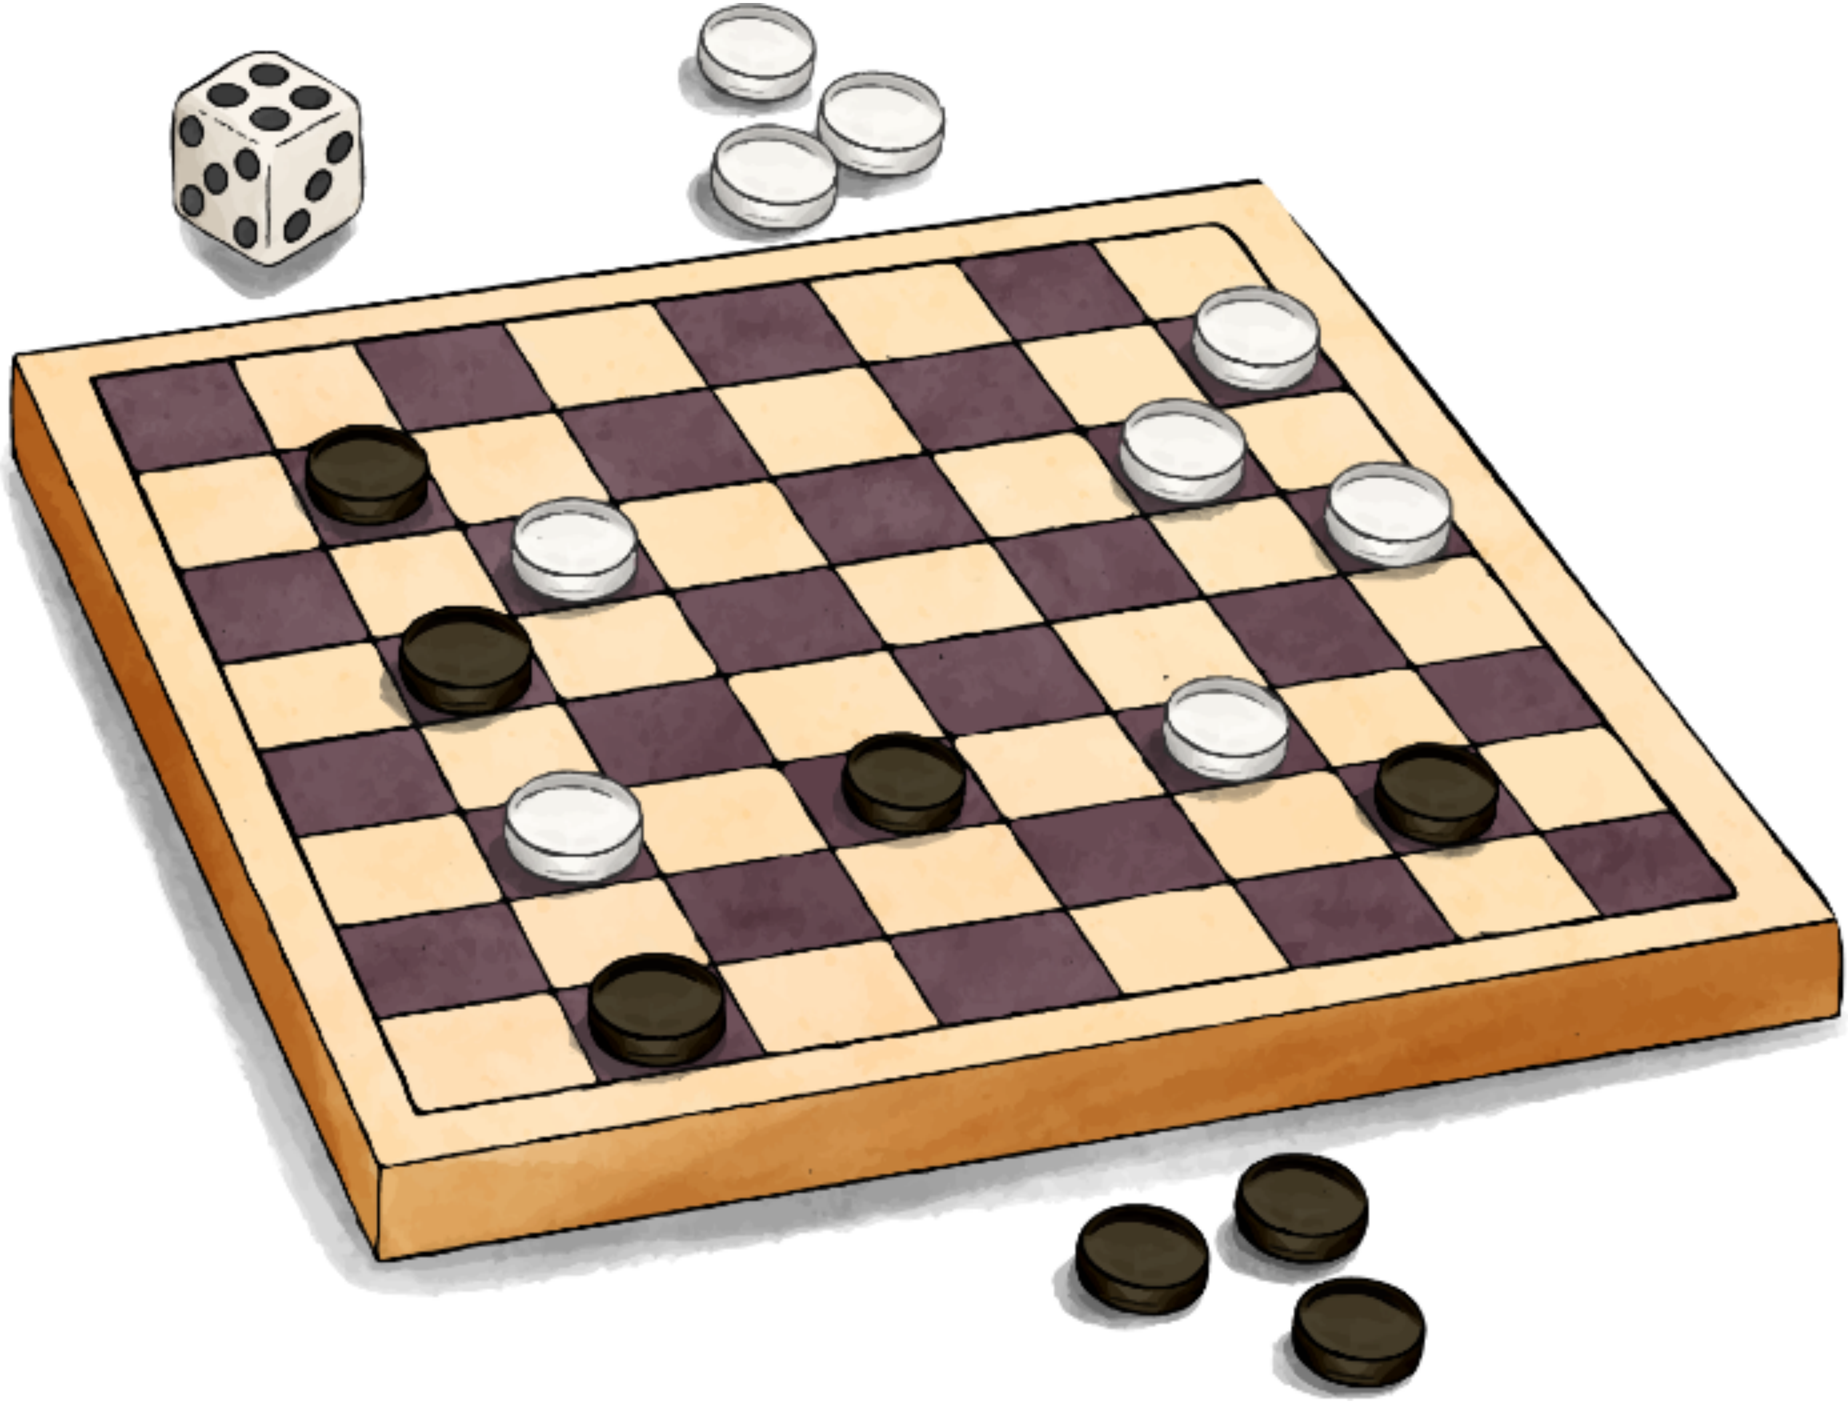
EXPERIENCE, TASK, PERFORMANCE!

19



- **Experience (E)**: the **data** or information that the machine learning model is trained on.
  `Example: The game of Checkers. Each game, whether it wins or loses, offers data and feedback for learning.`

- **Task (T)**: what you want the model to achieve or the problem you are trying to solve.
  `Example: Playing checkers, making valid moves to capture opponent's pieces or restrict their moves.`

- **Performance (P)**: a measure of how well the model is performing the task T after having been trained on the experience E.
  `Example: Evaluating computer win rates, move quality, and pieces captured.`

EXPERIENCE, TASK, PERFORMANCE!

- Experience (E): the **data** or information that the machine learning model is trained on.
  `Example: The game of Checkers. Each game, whether it wins or loses, offers data and feedback for learning.`

- Task (T): what you want the model to achieve or the problem you are trying to solve.
  `Example: Playing checkers, making valid moves to capture opponent’s pieces or restrict their moves.`

- Performance (P): a measure of how well the model is performing the task T after having been trained on the experience E.
  `Example: Evaluating computer win rates, move quality, and pieces captured.`

A computer program is said to learn from experience E with respect to some class of tasks T and performance measure P, if its performance at tasks in T, as measured by P, improves with experience E.

DOES MORE DATA (EXPERIENCE) LEAD TO BETTER PERFORMANCE?
