

WHAT ELSE IN THIS COURSE?

Deep learning is a powerful tool that uses neural networks with many layers (hence “deep”) and can be applied to various types of learning tasks, including supervised, unsupervised, and reinforcement learning.

A neural network is a type of computer algorithm inspired by the structure of the human brain. It is designed to recognize patterns in data and make predictions or decisions based on it.

Feature Selection in machine learning is the process of selecting the most important features or variables from the dataset.

ML Pipeline, as a series of automated steps that streamline the entire process of creating a machine learning model, including collecting and cleaning data, selecting features, choosing and training a model, evaluating its performance, deploying it, and monitoring and updating it as needed.

Torture the data, and it
will confess to anything!

~ Ronald Coase, Nobel Winner & Economist
